Just to make fun

The Product

a tool for generating videos similar to those that grandmothers usually send to their grandchildren in WhatsApp

Our Intention

Target users

grandmothers and zoomers

Final goal

to create a tool for generating stylized video sequences.

Importance

to save users’ time on searching/creating videos

to provide them with greater opportunities for generating content

Stylized images

The Solution

We want to use a pre-trained model because training our own generative model from scratch is difficult. Therefore, we decided to fine-tune the model using a LoRA to achieve a characteristic WhatsApp-style look.

stable-diffusion-2-1-base + custom-trained LoRA

Dataset

Around 50 hand-picked images with a distinctive cringe-like style, featuring glitter, collages, glare, and sunbeams.

Image prompts

Based on the Russian name of the holiday, we need to generate prompts that we'll pass to the image generation model. The prompts must be in English so the model can understand them.

Translator

Helsinki-NLP/opus-mt-ru-en

Prompt generator

Qwen/Qwen2.5-1.5B-Instruct

Image prompts

Event name: Новый год

Topic translation: New Year

Prompts:

(1): New Year's Eve fireworks display, neon lights, glitter sparkles, soft bokeh, postcard, no text

(2): Snowflakes falling gently, peaceful winter landscape, pastel background, glossy highlights, photomontage postcard style, no text

(3): Clock striking midnight, candles lit, festive decorations, soft bokeh, postcard, no text

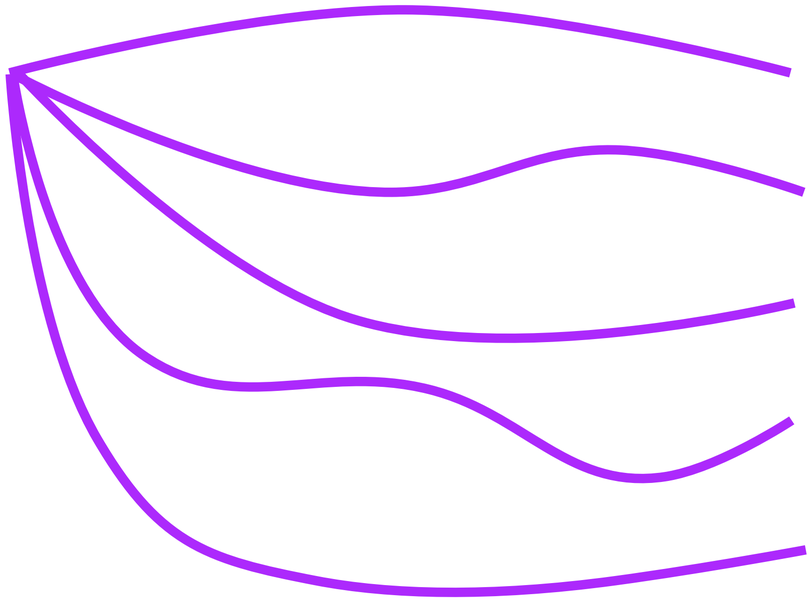

Image captions

1 Text generation

We have to generate a series of captions to place them on images

Qwen/Qwen2.5-1.5B-Instruct

Новый год

С Новым годом

Добро пожаловать

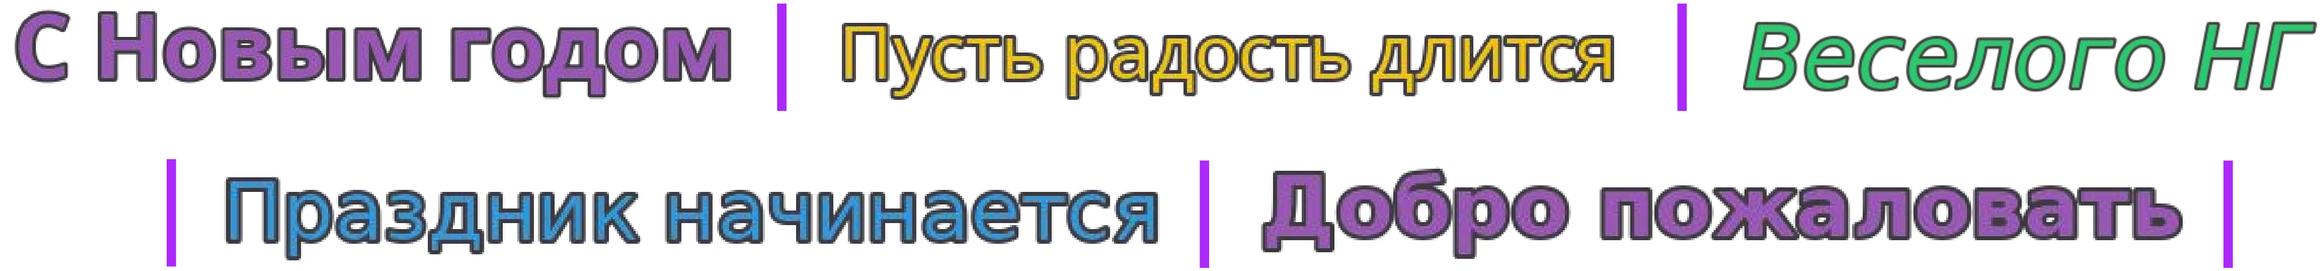

Пусть радость длится

Праздник начинается

Веселого НГ

2 Caption rendering

To overlay a caption on an image, we need to generate a separate image with a beautiful caption. For this, we'll use a well-known Python library Pillow

3 Caption overlay

We want to ensure that when overlaying a caption on a photo, the caption doesn’t obscure important semantic parts of the image.

replicate.com/bytedance/seedream-4

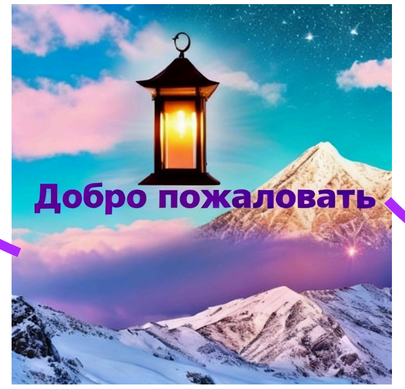

Video splicing

Video creation

We need a lightweight API to combine our images into a video sequence, possibly with awkward transitions between them. Use shotstack.io
